

Construction impacts are temporary, but flood protection is generational

Did you know that noise, dust, and traffic changes during our construction are temporary conditions that are common inconveniences but lead to long-term improvements for thousands of residents and business owners?

Construction impacts are managed and minimized

- Contractors must follow strict environmental and safety requirements.
- Mitigation measures include, but are not limited to, dust control, noise control, vibration monitoring, and traffic management.

Short-term inconvenience leads to long-term protection

- Construction lasts a few years but flood protection projects like the Rio Puerto Nuevo Flood Risk Management Project will last for generations.

- Once completed, the system reduces risk for tens of thousands of residents.
- The benefits far outweigh the temporary impacts.

USACE maintains communication throughout construction

- Residents receive updates on schedules, closures, and progress.
- Community concerns are addressed as they arise.
- Transparency is part of the project's commitment to public safety.

BOTTOM LINE:

Construction impacts are temporary and managed. The flood risk reduction that follows is permanent, lifesaving, and essential for San Juan's future.
